An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Indee Organ: Stomach; Vector: pCNS; Site_1: EcoRI; Site_2: NoLI; The poly (A)+ RNA was decapped with Labacco acid pyrophosphatase (TAP) and ligated with DNA-RNA linker including EcoRI site by treatment of T4 RNA ligase. The first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-talled vector. The dT-talled vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion was circularized with E. coli DNA ligase after digestion

For further information please see http://www.fruitfly.org The BDEP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pleter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDCP from the 1sogenic strain y2; on bw sp, the same strain used for the BDGP's
